

The Oklahoma Climatological Survey was established with its own budget and offices in the spring of 1980. The mission of the Survey is to provide a climatological archiving and information service to the State of Oklahoma. Although as many as 160 stations may appear in any one Summary, it may not be possible to list every station report received at the Survey as we plan to have the summaries in the mail before the middle of each month. If you would like information about a station that does appear, please feel free to contact the Climate Survey. If you would like to know more about the services we offer or our plans for the future, please let us hear from you. You can help us by contributing to our newspaper clipping file. If you see an article in your local newspaper dealing with some impact of climate on your community, please clip it and send it to us along with the name of the newspaper and the date the article appeared.

OKLAHOMA CLIMATE SUMMARY JULY 1986

Record-setting high temperatures during the last week of July pushed monthly average temperatures 1 to 3 degrees above normal across the entire State. Every station experienced at least one day of 100 degree temperatures and many reported more 100 degree days than average (see table 1). The highest officially recorded temperature occurred on the 29th when Buffalo reported 115 degrees. Bixby's 53 degree reading on the 16th was July's lowest. Precipitation for the month was below normal for most of the State with some areas receiving less than 20% of their normally expected rainfall. Several stations in central and south central Oklahoma reported no measurable precipitation for the entire month.

Much of the July rainfall which did occur in Oklahoma fell from strong thunderstorms. This was the case on the afternoon of July 6th as intense surface heating and ample gulf moisture triggered a line of thunderstorms along a weak front across northwest Oklahoma. A flash flood warning was issued for Beckham County. Radar estimates indicated that the storm produced more than 4 inches of rainfall in nearby areas. Elk City reported 3.84 inches of rain with extensive damage to an airport hangar attributed to wind gust of near 85 mph.

More severe weather battered the northeastern part of the State on the 12th. The thunderstorms resulted when a cooler air mass from the northwest collided with the present, hot air in northeastern Oklahoma. This produced 24-hour rainfall amounts of 4.83" at Ramona, 4.0" at Nowata and 3.41" at Pryor. In Fairland, a lightning strike from one of these storms was blamed for starting a house fire which claimed the life of a 78 year old man.

Temperatures began to rise during the middle of the month. On the 13th, high temperatures included Lahoma 102; Chattanooga 101; and Carnegie and Hammon 99. Altus recorded 100 degrees and 1.95" of rain while Frederick also in southwest Oklahoma reached 101 degrees and received 1.91".

The heat intensified during the last week of the month and many stations recorded several consecutive days of 100 degree weather. Woodward and Lahoma claimed the highest temperatures in the country on the 28th with readings of 112 degrees. The 108 degree reading at Oklahoma City broke the previous record by 4 degrees. On the next day, the 109 degree reading at Oklahoma City tied its all time high July temperature record. Enid and Bartlesville also recorded 109 degrees.

The severe heat posed 2 major problems: health and water shortage. The Oklahoma Health Department issued the summer's first Heat Health Alert on the 28th. The Governor's task force, convening on the same day, announced a Statewide toll free Heat Telephone Line (1-800-522-9054). Other efforts to assist those having heat related problems included making air conditioned public places available as refuges and disseminating donated fans to the needy. Though many were helped through these efforts, 5 Oklahomans died from heat stroke in July according to a state medical examiner's office.

The extremely high temperatures and insufficient precipitation resulted in record-setting water consumption. Both Tulsa and Oklahoma City broke daily water usage records during the last week of the month. In Edmond, water taps temporarily went dry. In response to the stress on the water supply, eight cities and towns began mandatory water rationing, mostly to curtail outdoor water usage.

Fortunately, a cool front began moving through northern Oklahoma the last day of the month. Tulsa's high temperature was 97 degrees, down 13 degrees from the previous day's high.

Table 1. Number of Days in July with Temperature $\geq 100^{\circ}\text{F}$ for Selected Cities and Years in Oklahoma.

Tuskahoma	81.0	84.6	3.662	.771

JULY EXTREMES

Variable	Station	Division	Observation	Date
Minimum temperature (F)	Turpin	1	52	16
Maximum temperature (F)	Smithville	9	115	30
Maximum 24-hour precipitation	Bartlesville	3	5.15"	13

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above provides the general station distribution and the locations of the climate divisions. Each station table contains the following:

station name:

station identification number: These are usually assigned by the National Climatic Data Center.

climate division: See the figure above.

mean monthly temperature:

number of temperature observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

deviation from normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

maximum daily maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

minimum daily minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

heating degree days: HDD are calculated each day of the month for which there is a temperature report and summed. They are a qualitative measure of how much heat was required to maintain an indoor temperature of 65 degrees. Missing observations may result in a artificially high or low value. For February 1984 HDD would be calculated as:

$$29 \sum_{i=1}^{ } (65 - (TMAX_i + TMIN_i)/2)$$

deviation from normal heating degree days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

cooling degree days: CDD are calculated each day of the month for which there is a temperature report and summed. They are a proxy measure of how much cooling was required to maintain an indoor temperature of 65 degree. Missing observations may result in an artificially high or low value. For June, CDD would be calculted as:

deviation from normal cooling degree days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

total precipitation: Often incorrectly referred to as mean precipitation this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

number of precipitation observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

deviation from normal precipitation: A positive value indicates more rain than normal was received. A negative valued indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

maximum 24-hour report and day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

EXPLANATION OF MAPS

To give a statewide perspective, a series of maps is produced each month from the information contained in the station tables. Each map is calculated using between 50 and 200 observations. Only station with complete monthly records are used. Each observation is put into one of three categories and assigned a plus (+), minus(-), or a dot (.). The minus is the lowest numeric catory, the dot is the middle and the plus the highest numeric category. If a map location has no report, a value is estimated. Each map is accompanied by its own legend. The categories will vary from month to month throughout the year. The categories for the deviations from normal maps will always remain constant. This is to facilitate comparisons between months and across years.

Note: 9999.0, 999.0, 99.99 indicate missing records.

Trace = .001

Legend:

- - - 77.1 to 80.5
- . . . 80.5 to 84.0
- + + + 84.0 to 87.5

JULY 1986 AVERAGE MONTHLY TEMPERATURE
(DEGREES F)

-- Normal
(less than 2.0)
... Above normal
(2.0 to 4.0)
+++ Much above normal
(greater than 4.0)

JULY 1986 DEVIATION FROM NORMAL TEMPERATURE

- - - 362.5 to 472.0

. . . 472.0 to 583.0

+ + + 583.0 to 695.5

JULY 1986 TOTAL COOLING DEGREE DAYS

- - - Below normal
(less than -100)

... Normal
(-100 to 100)

+ + + Above normal
(greater than 100)

JULY 1986 DEVIATION FROM NORMAL COOLING DEGREE DAYS

- - - 0.0 to 2.0
 . . . 2.0 to 4.0
 + + + 4.0 to 6.58

JULY 1986 TOTAL PRECIPITATION
(INCHES)

- - - Below normal
(less than -2.0)
- . . . Normal
(-2.0 to 2.0)
- + + + Above normal
(greater than 2.0)

JULY 1986 DEVIATION FROM NORMAL PRECIPITATION

SEPTEMBER 1936 CLIMATE CALENDAR

The data on this calendar are for Oklahoma City. Normal values are calculated for the period 1950-1979. Extremes are found for the period of record (1924-present).

1		Actual	Normal 2	Actual	Normal 3	Actual	Normal 4	Actual	Normal 5	Actual	Normal 6	Actual	Normal 7	Actual
