### MONTHLY SUMMARY FOR JANUARY 1993

An ice and sleet storm on New Year's Eve blanketed most of Oklahoma, paralyzing holiday travel and starting 1993 on a wintry note. According to preliminary data from most of the state's reporting stations, temperatures for the month ranged from below zero in the Panhandle on the morning of the 13th to the low 70s in parts of western Oklahoma on the 31st. The statewide average temperature for January, 36 degrees, was four-tenths of a degree below normal. Precipitation continued to be plentiful, averaging 2.15 inches across the state, exceeding the normal for the month by .89 inch.

The New Year's Eve storm, which continued through the first, led to the closing of many highways in all but extreme southeastern Oklahoma. More than 60 vehicles were involved in two separate chain-reaction accidents in Oklahoma City early on the morning of the 1st, as travelers found the highways to be treacherously slick. Travel to and from Oklahoma City was hindered even more when two airplanes slid off an icy runway at Will Rogers Airport.

Warmer weather, which began to return to the state by the 2nd, melted the ice but led to the development of dense fog over many areas on the 2nd and 3rd. Several locations, mainly in southern and eastern parts of the state received over an inch of precipitation during the first week of the year, led by Broken Bow which reported 1.50 inches on the 4th.

Another round of winter weather arrived late on the 7th. Episodes of mainly snow and ice in the north and rain in the south continued to affect the state through the 21st. Cherokee reported 8 inches of snow on the 9th. Buffalo reported 7.5 inches and Guymon, Alva and Grainola each chipped in with 6 inches during the same period. Ice was reported as far south as Healdton on the 10th and a reported 6 to 7 inches of snow fell at Braman on the 11th.

A storm system which crossed the state on the 14th produced sleet and freezing rain all across the northwestern one-half of the state, extending as far southeast as Pittsburg and Latimer counties. The storm produced significant rain in eastern Oklahoma. Short reported 1.53 inches of precipitation on the 14th and another 2 inches fell by the morning of the 15th. Temperatures in the northwest plunged in the wake of the cold front. Guymon reported a low of -2 on the 13th and thermometer readings in the lower single-digits were common on the 13th and 14th.

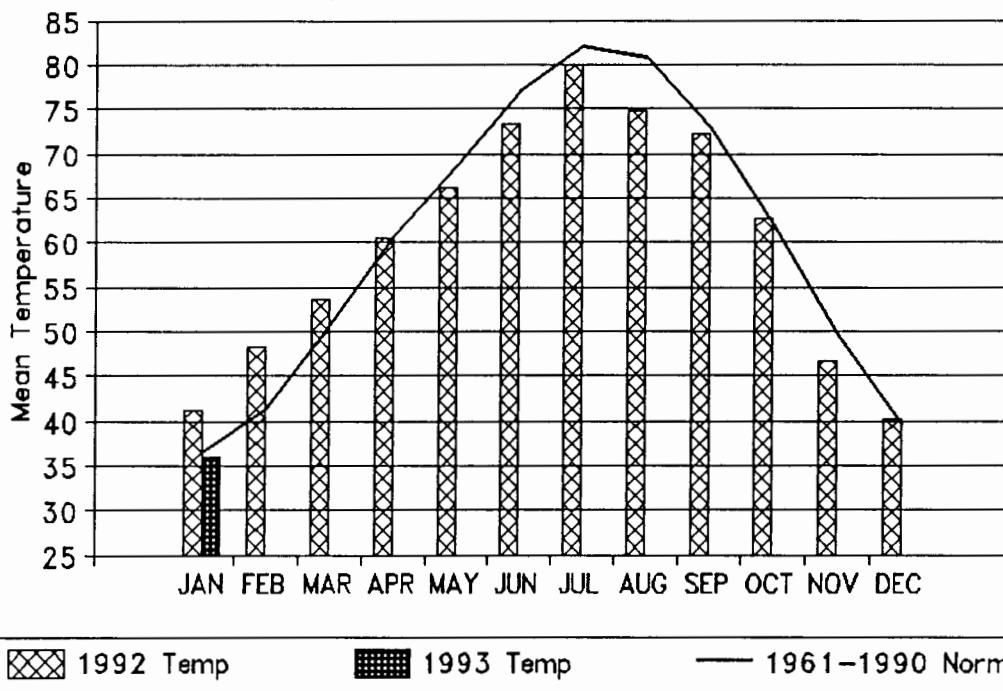

Freezing rain and snow were reported in northeastern Oklahoma on the 17th, including 3.5 inches of snow reported at Hollow and Lenapah. More ice and snow were ushered into the state on the 18th, including up to 6 inches of snow in parts of the Panhandle. Accumulations of ice were reported in Tulsa on the 19th and Wilburton reported 1.50 inches of rain. Sallisaw reported 1.59 inches on the 20th.

The weather was relatively calm during the last 10 days of the month. Fog, occurring with sub-freezing temperatures in southwestern Oklahoma on the 20th and 21st, left a thin coating of ice on grass and trees. Some light snow was reported in the Panhandle on the 23rd and again on the 26th with over 3 inches falling in the Hooker area on the latter date.

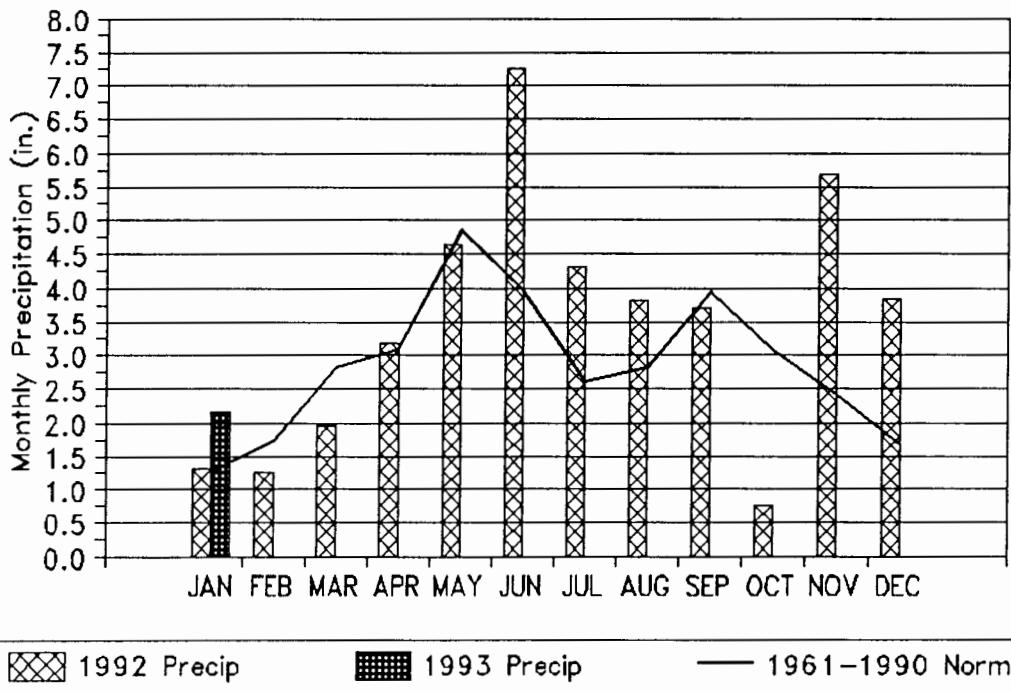

By month's end, daily maximum temperatures in the 60s were common over much of the state, although lows reached into the teens in many places in the north. Precipitation ended in all but the southeast, where it was greatly reduced during the last week of the month.

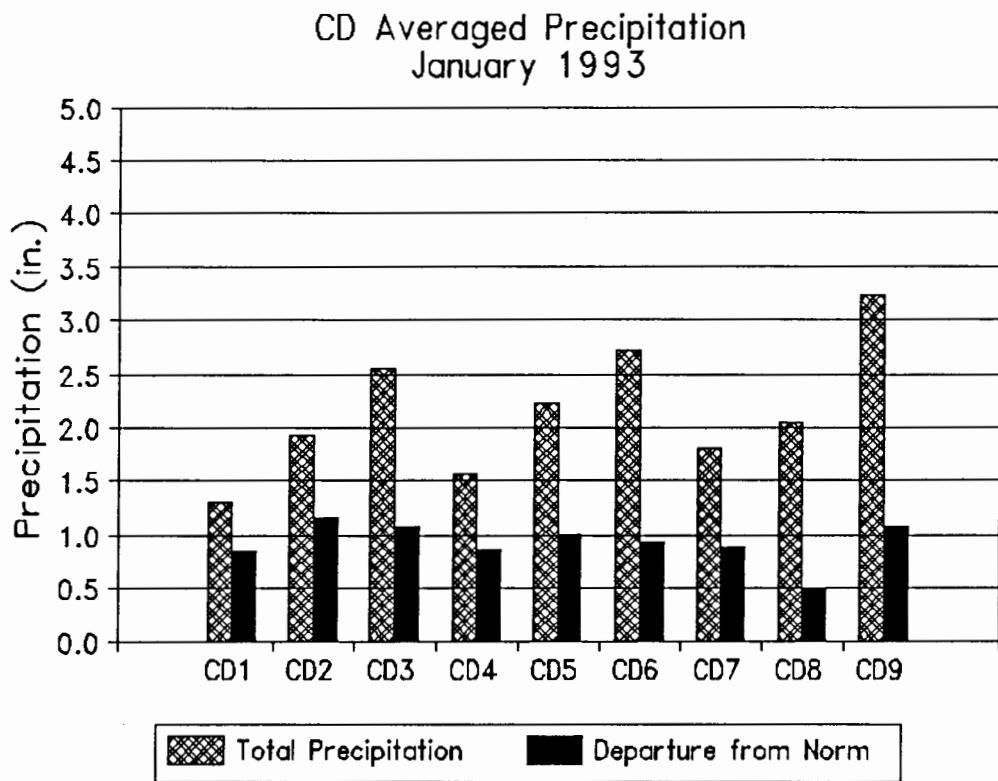

Howard L. Johnson

**EXPLANATION OF TABLES**

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and summed. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

29

$$\sum_{i=1}^{29} 65 - ((TMAX_i + TMIN_i)/2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and summed. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i)/2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

## OKLAHOMA CITY CLIMATE CALENDAR

March 1993

The data on this calendar are for Oklahoma City.  
 Normal values are calculated for the period  
 1961-1990. Extremes are found for the period  
 of record (1891-present).
