JUNE 1993 OKLAHOMA SUMMARY

A late-season storm pattern continued to bring cold fronts into Oklahoma throughout June. Precipitation was spread uniformly across the state, with every region receiving near-normal rainfall, but amounts at individual stations varied considerably. Flash flooding was a common occurrence, as rain fell on ground already saturated from the previous month's near-record precipitation in many areas. Rainfall was reported on all but one day, and 22 days featured rainfall amounts of one inch or greater. The state averaged 3.55 inches of precipitation in June, 0.40 inch below normal. The year-to-date stands as the 12th wettest on record with 23.09 inches, more than 5 inches above normal.

Frequent frontal passages prevented extended warm spells, keeping the temperature to near-normal values. Preliminary data indicate an average temperature of 76.9 degrees, only 0.1 degree below the 1961-1990 normal. The year-to-date ranks as the 13th coolest so far, with an average temperature of 54.1 degrees.

The month began warm in southern Oklahoma, where daily maximum temperatures reached into the upper 90's. Northern Oklahoma, stuck behind a slow-moving cold front, reported maximum temperatures only in the 70's and low 80's and minimum temperatures in the 50's. Severe thunderstorms developed along the front on the 3rd, with numerous reports of baseball-sized hail and wind damage across northwest, north central and northeast Oklahoma. Grant County was especially hard-hit by the hailstorms, as 130,000 acres of wheat were destroyed resulting in nearly \$20 million in losses. The storms damaged houses and cars, stripped bark from trees and flattened crops near Wakita, making many fields look like they had already been harvested. Scattered instances of rainfall in excess of an inch were also reported.

High pressure settled across the state on the 5th and 6th. Minimum temperatures dipped as low as 45 degrees at Freedom and Gage on the 5th. The last remnants of the front cleared the state on the 6th, the only day during June where precipitation was not reported in the state.

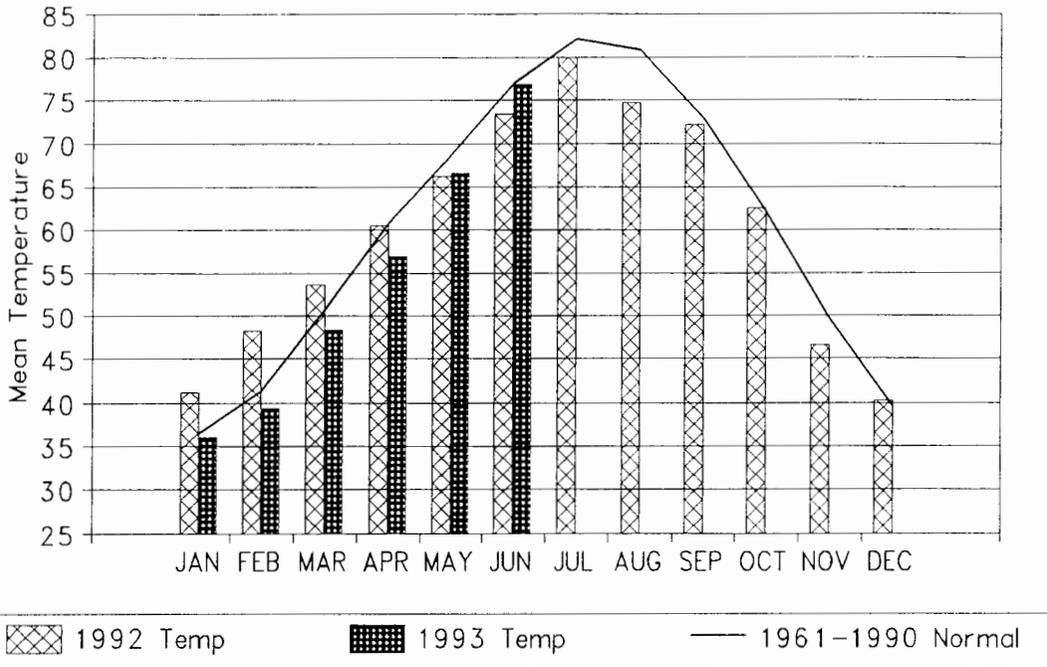

A spring-like storm system moved into Oklahoma on the 7th, with 54 counties falling under a tornado watch. Tornadoes were reported on the 8th near Newkirk and the 9th near Sapulpa and Broken Arrow. The strongest tornado, near Newkirk, remained on the ground over a 9-mile path. Strong straight-line winds also produced damage in Claremore, where the roof of a retirement home was destroyed, forcing the evacuation of 88 people. Precipitation in excess of two inches fell on many parts of eastern Oklahoma on the 10th as the storm system cleared the state.

A weather pattern characterized by weak upper-air winds and weak fronts dominated Oklahoma during mid-June. Maximum temperatures from the 11th through 18th were generally in the 80's and 90's and minimum temperatures in the 60's and low 70's. Except for the 11th and 13th, precipitation of one inch or greater was a daily occurrence. A stronger front moved across the state on the 19th and 20th, bringing rainfall to nearly every part of the state and producing 24-hour totals in excess of two inches at many locations. The highest totals were reported on the 20th with 4.24 inches at Norman and 4.00 inches at Apache.

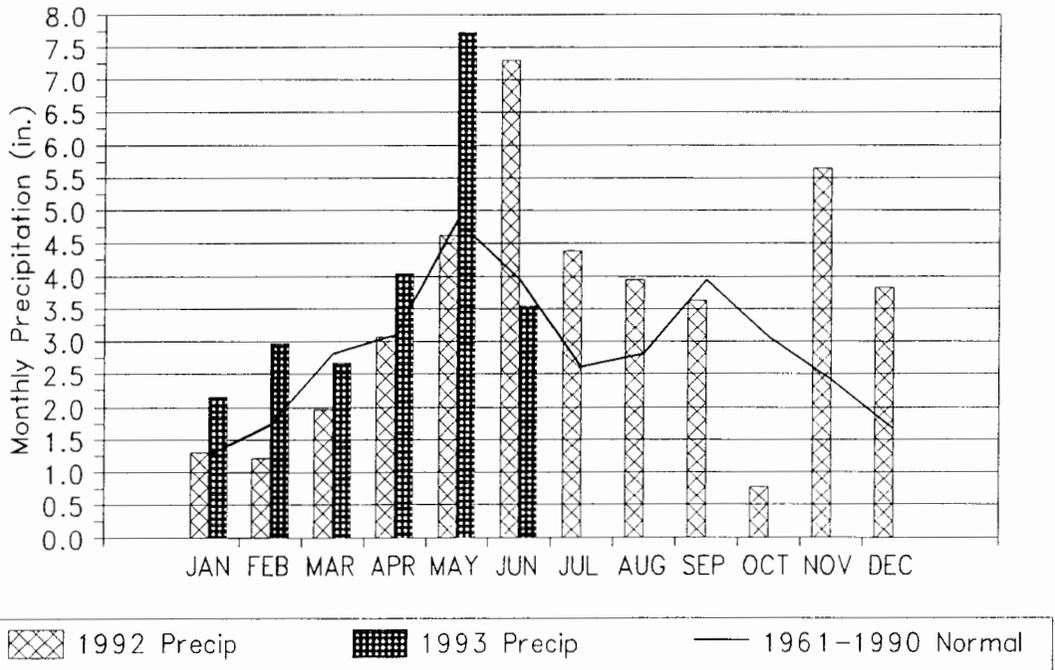

An extended period of heavy precipitation occurred from the 24th through the 27th. Daily rainfall totals again exceeded two inches at many locations, producing flash floods which swept a car from a road in Kay County. Damaging winds were also reported with storms during the period, with an 83 mph wind reported at Guthrie on the 24th and a 94 mph wind at Woodward the morning of the 27th.

As the last of the storm systems cleared the state, hot weather settled in. Maximum temperatures rose above the century mark at Guymon, which reported temperatures of 101 degrees on the 28th and 102 degrees on the 29th. Upper 90's were commonplace elsewhere in the state. Several reports of minimum temperatures in the upper 70's were received for the 29th and 30th, and minimum temperatures in the 70's were reported everywhere except Blanchard (69 degrees) on the 30th.

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$\sum_{i=1}^{29} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i) / 2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

The data on this calendar are for Oklahoma City.
 Normal values are calculated for the period
 1961-1990. Extremes are found for the period
 of record (1891-present).
