MONTHLY SUMMARY FOR JUNE 1996

Welcome precipitation fell over most of Oklahoma during June, but the state still registered less-than-normal monthly precipitation for the eighth time in the last nine months. The June statewide-averaged precipitation of 3.71 inches was .24 inch lower than normal, ranking as the 53rd driest June since 1892. Northern and central Oklahoma generally continued dry throughout the month, although precipitation amounts varied greatly from station to station. The extent of the drought of recent months is apparent in the longer term precipitation record. Thus far, 1996 is the 8th driest year on record and the driest since 1972, with a total precipitation of 11.34 inches, 6.37 inches below normal. Statewide precipitation since October 1 is a meager 14.82 inches, 10.10 inches less than normal, the 3rd lowest October through June precipitation ever recorded for Oklahoma. This ranks behind 1910-11 (12.74 inches) and 1955-56 (14.78 inches).

Temperatures for the month averaged 77.8 degrees, .8 degree above normal, to rank 35th warmest all time. The year-to-date average temperature for the state is 56.2 degrees, .3 degree greater than normal, making this the 45th warmest first half of a year in Oklahoma.

Transient weather systems finally started reaching Oklahoma again during the first half of the month. Madill (Marshall County) reported 4.10 inches of rain on the 1st. Other local downpours in south central Oklahoma included 3.50 inches at Duncan (Stephens), 3.40 inches at Pauls Valley (Garvin), 3.29 inches at Lindsay (Garvin), 3.25 inches at Purcell (McClain) and 3.20 inches at Tishomingo (Johnston). Damaging winds and large hail were reported frequently through the first week of the month. A possible tornado was reported just southwest of McAlester (Pittsburg) on the 6th.

The generally moist pattern persisted through the 17th, but precipitation remained localized rendering the rainfall ineffective at alleviating the drought in many areas. A slow moving thunderstorm southwest of Cheyenne (Roger Mills) dropped 10.65 inches of rain in about six hours, as measured by the local Oklahoma Mesonet automated weather observing site. Most of the precipitation (9.43 inches) fell in two hours between shortly before 10 PM and shortly before midnight. Roosevelt (Kiowa) reported 4.50 inches of rain on the 16th and several stations reported daily rainfall amounts of two inches or more from the 12th through the 17th.

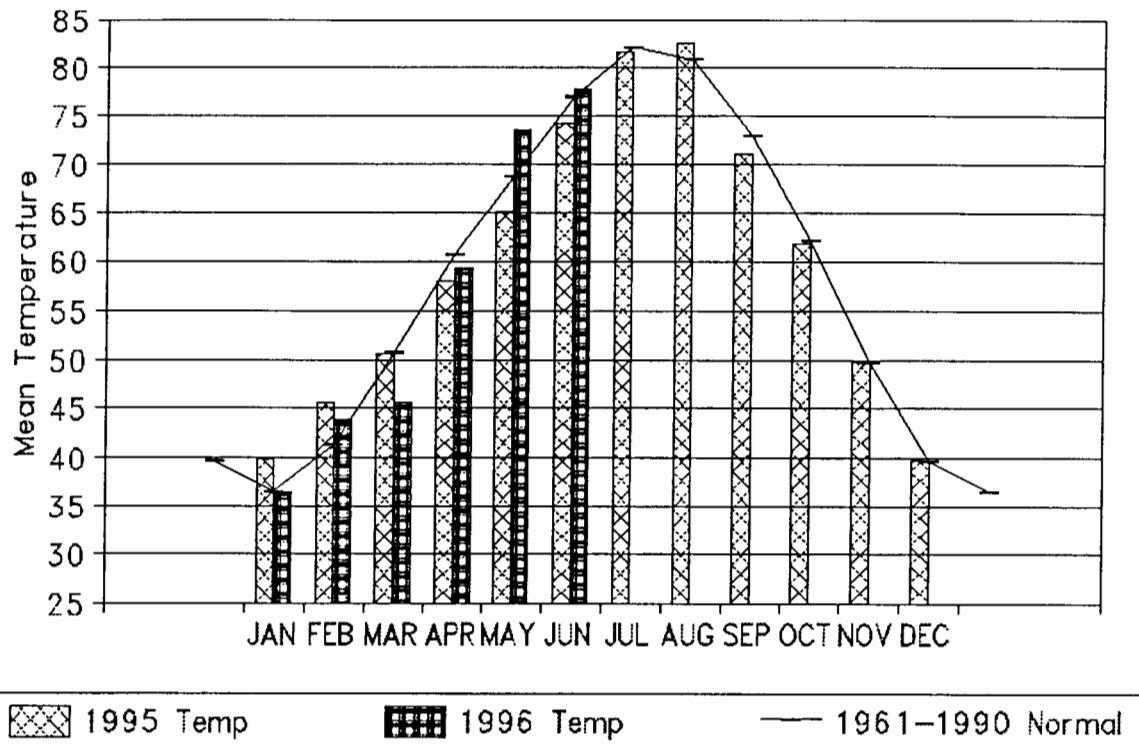

Drier and hotter weather dominated the state from the 18th through the 24th. Hundred-degree-plus temperatures were commonplace in the west, although locally heavy thunderstorms could still pack a punch. The National Weather Service observer at Hollis (Harmon) reported winds of 121 miles per hour during a thunderstorm on the 18th and a brief tornado was reported in northern Tulsa County on the 19th. Chattanooga (Comanche) reached 108 degrees on the 19th with Altus (Jackson) and Frederick (Tillman) chipping in with 107 degree readings.

Heavy rains produced local flooding in northwest Oklahoma on the 23rd when 4.25 inches reportedly fell near Goodwin (Ellis) and on the 25th when 4.72 inches of rain fell at Boise City, closing a highway and washing out a rail crossing.

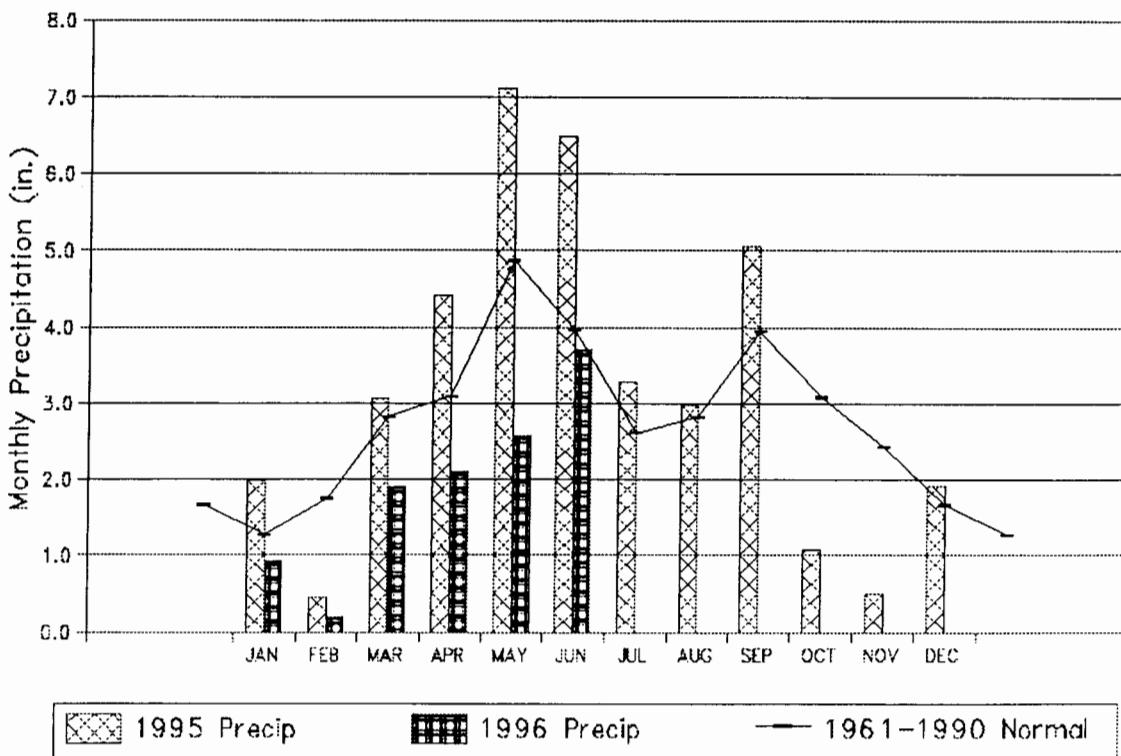

Summer asserted itself from the 26th through the end of the month, as precipitation decreased, statewide, and temperatures reached triple digits in much of southern, western and central Oklahoma, peaking at 105 degrees at Alva (Woods) on the 29th.

OKLAHOMA

CLIMATE DIVISIONS (CD)

- 1 - Panhandle
- 2 - North Central
- 3 - Northeast
- 4 - West Central
- 5 - Central
- 6 - East Central
- 7 - Southwest
- 8 - South Central
- 9 - Southeast

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$\sum_{i=1}^{29} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i) / 2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

OKLAHOMA CITY CLIMATE CALENDAR

AUGUST 1996

The data on this calendar are for Oklahoma City.
Normal values are calculated for the period
1961-1990. Extremes are found for the period
of record (1891 - present).
