MONTHLY SUMMARY FOR APRIL 1998

April was generally cool and dry across Oklahoma. According to preliminary data from the National Weather Service, temperatures for the month averaged 3.5 degrees lower than normal (57.2 degrees, averaged statewide, the 13th lowest April temperature since 1892). Despite some locally heavy rainstorms late in the month, the statewide-averaged monthly precipitation of 2.67 inches was 0.42 inch lower than normal, making 1998 the 37th driest April in 107 years of available records. The lack of rainfall was most pronounced in southeastern Oklahoma, where many areas received monthly precipitation that was less than half of normal for the month. The year-to-date statistics show 1998, thus far, to be 0.3 degree cooler than normal (47.1 degree average temperature, 45th lowest) with much greater than normal precipitation (13.15 inches, 4.25 inches greater than normal, 9th wettest January-through-April on record).

Thunderstorms on the 6th produced isolated instances of large hail, wind gusts as great as 69 miles per hour (Butler Mesonet in Custer County) but limited precipitation. The largest precipitation total reported was 1.50 inches at Lamont (Grant). One-inch or greater precipitation was next reported on the 14th. Strong thunderstorms on that date produced large hail and damaging winds. Reported hail stone diameters included: 3 inches south of Ponca City (Kay), 1.75 inches at Ninnekah (Grady), and 1.5 inches near Apache (Caddo). Winds estimated at 80 miles per hour were reported at Cooperton (Kiowa). Lyons (Adair) reported 1.50 inches of rain.

A 10-day period of mild weather culminated with a transition to hot on the 24th when Hollis (Harmon) reported a daily maximum temperature of 96 degrees and Altus (Jackson) and Beaver Mesonet (Beaver) registered 95 degrees each. The warm spell was somewhat short-lived as a storm system that brought heavy rain to much of the northern two-thirds of the state moved through on the 26th. A tornado was reported near Boswell (Choctaw) and wind damage was common across southern Oklahoma. Local flooding was reported in an area bounded by Oklahoma City on the west and Lake Eufaula on the east and extending from Osage County southward to Murray and Pontotoc counties. Pawhuska (Osage) recorded a two-day total precipitation of 6.15 inches reported on the 26th and 27th. Bowlegs Mesonet (Seminole), Bristow (Creek), Mannford (Creek), Maramec (Pawnee), Oilton Mesonet (Creek), Skiatook (Osage/Tulsa), Trousdale (Pottawatomie), Pawnee Mesonet (Pawnee), Burbank (Osage), Wynona (Osage), and Konawa (Seminole) all reported more than 5 inches of rain over a two-day period. Local flooding was also reported in Stillwater (Payne), Hominy (Osage), and near Wewoka (Seminole).

Howard L. Johnson

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$\sum_{i=1}^{29} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i) / 2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

OKLAHOMA CITY CLIMATE CALENDAR
 DATA COURTESY OF NATIONAL WEATHER SERVICE NORMAN.

JUNE

The data on this calendar is for Oklahoma City.
 Normal values are calculated for the period 1961-1990
 Temperature extremes are for the period 1891-1997
 Precipitation extremes are for the period 1891-1997
