JUNE 1992 MONTHLY SUMMARY

Heavy rains and damaging thunderstorms repeatedly hit Oklahoma during June, making the month the sixth wettest since 1892. Over an inch of rain was reported somewhere in the state on 25 days during the month, with over two inches falling on 15 days. The statewide-average was 7.27 inches, which is 3.32 inches above normal. Every region of the state recorded above-normal precipitation. Only Hooker, Miami and Spavinaw reported below-normal precipitation, among 129 stations which have 30-year normals. Seminole, Wewoka and Muskogee led all reporting stations with over twelve inches of rain for the month.

Grey skies kept temperatures cool. The highest reading of the month was 103 degrees at Clinton on the 18th, and maximum temperatures climbed above 100 degrees at only 15 reporting stations over six days. Minimum temperatures fell as low as 37 degrees at Stillwater on the 2nd. The statewide-average temperature of 73.6 degrees, which is 3.4 degrees below normal, tied for the fifth coolest on record.

A cold front, stalled south of the Red River, kept much of Oklahoma cool during the early part of the month. Record low temperatures were reported during the first two days of the month. The stalled front also provided a focus for rainshower development. Precipitation totals in excess of three inches were reported at Oneta on the 3rd, and Boynton and Tahlequah on the 6th. A two-day total of 6.03 inches was reported at Muskogee on the 5th-6th.

Thunderstorms developed across western portions of the state in advance of a cold front on the 5th. Baseball-size hail was reported in Stephens County and strong winds caused damage across Carter and Grady counties. Although the front cleared the state quickly, a pocket of cold air remained aloft, making the air unstable enough to allow for daily development of thunderstorms. No part of the state was spared from the inundation, which lasted until mid-month. Daily rainfall totals in excess of two inches were common from all parts of the state through the 15th. The heavy rains stopped the wheat harvest in many parts of the state, and caused flooding of major creeks and rivers.

Skies finally cleared on the 15th, allowing maximum temperatures to rise above the 100-degree mark on the 17th and 18th. A new storm system began affecting Oklahoma's weather on the 18th, as thunderstorms developed across northwest Oklahoma. Two tornadoes were produced in Major and Kingfisher counties by the storms as they sped southeastward. A third tornado was produced near Maramec in Pawnee County. None of the tornadoes produced much damage. Although tornadic activity ceased before the storms arrived in the Oklahoma City Metro Area, large hail and winds gusting over 70 mph produced substantial damage.

A more substantial and widespread storm complex developed during the morning of the 19th in south central Kansas, moving southeastward across much of northeast Oklahoma during the afternoon. Wind gusts of 70-80 mph were reported as the storms swept across an eleven-county area at speeds of over 50 mph. The most damaging winds hit Tulsa, Creek and Pawnee counties, where wind speeds as high as 100 mph were reported. Throughout the area, trees were uprooted, fences and powerlines were blown down and roofs were damaged. Heavy rains, including 4.12 inches at Beggs and 3.50 inches at Claremore, filled rivers to their banks.

Thunderstorms continued to plague Oklahoma for the remainder of the month. Strong winds, large hail and heavy rains were an almost daily occurrence across all parts of the state. Already saturated from previous storms, the ground was not able to absorb the rains, resulting in flash flooding. Carter, Bryan and Creek counties were especially hard-hit on the 28th. At the end of the month the cool, wet weather showed no signs of letting up.

JUNE 1992 COOLING DEGREE DAYS

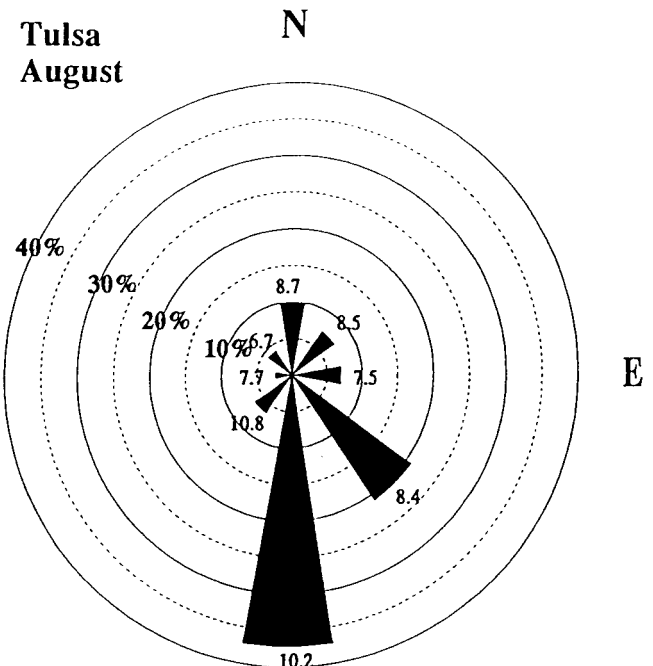

JUNE 1992 DEVIATION FROM NORMAL COOLING DEGREE DAYS

August wind roses for Oklahoma City and Tulsa. Percents represent the percentage of winds coming from a direction. The numbers at the end of the bars indicate the average speed (miles per hour) of winds from that direction.

Calm=1.5%
Mean Speed= 10.5 mph

Calm=4.9%
Mean Speed= 8.7 mph

AUGUST 30-YEAR MEAN DAILY MAXIMUM TEMPERATURE

AUGUST 30-YEAR MEAN DAILY MINIMUM TEMPERATURE

AUGUST 30-YEAR MEAN MONTHLY PRECIPITATION

90-DAY NATIONAL WEATHER SERVICE OUTLOOK

(July - September 1992)

Precipitation - Near Normal Northeast
Above Normal Elsewhere

Temperature - Below Normal Statewide

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and summed. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i)/2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

The data on this calendar are for Oklahoma City.
 Normal values are calculated for the period
 1961-1990. Extremes are found for the period
 of record (1891-present).
