MONTHLY SUMMARY FOR OCTOBER 2000

A series of widespread, heavy rain events during the last half of October effectively ended Oklahoma's two-and-one-half-month long summer drought. The heavy rains, evident everywhere except in the southeast, replaced drought and withering crops with floods and ground that was too wet to allow planting of winter wheat. The statewide averaged precipitation for the month, 6.49 inches, was 3.42 inches greater than normal, which ranks October 2000 as the 6th wettest of the 109 Octobers since reliable record keeping began in 1892. Most notably, the northwest climate division, comprising the Panhandle and two other counties, recorded nearly five times its normal October rainfall. Conversely, the southeast climate division only received 80 percent of its normal October precipitation.

The month offered a mixed bag of temperatures. Daily maximum temperatures in triple digits early in the month, including a state-record October high temperature, were swiftly replaced by an extremely early first-freeze that blanketed most of the state near the end of the month's first full week. Nonetheless, The statewide-averaged temperature for the month, 64.1 degrees, was 2.0 degrees greater than normal and ranks this as the 28th warmest October yet recorded.

The year-to-date statewide-averaged temperature of 65.3 degrees is 1.8 degrees greater than normal, giving 2000 the 13th warmest first ten months of any year since 1892. Precipitation, averaged across the state, has totaled 31.21 inches, 1.06 inches greater than normal and the state's 43rd greatest January-through-October precipitation.

The first few days of the month were much like the previous two months – hot, dry, and no relief in sight. Hollis (Harmon County) set a new state record for October by reaching a high temperature of 106 degrees on the 3rd. A surge of cold air cruised through the state beginning late on the 5th to provide relief from the heat and set the stage for the abrupt transition from drought to flood that was to follow. Most of the state experienced an extremely early freeze on the 9th, and the all but isolated reporting stations followed suit over the next two days. Hammon (Roger Mills), Canton Dam (Blaine), and the El Reno (Canadian) Mesonet site all recorded minimum temperatures of 16 degrees on the 9th. Low temperatures in the upper teens and lower 20s were commonplace for the next couple of days. Although temperatures moderated fairly rapidly and no further sub-freezing values were recorded after the 11th, significant damage was done to the state's pecan crop.

Although substantial rain, including 1.40 inches at Sallisaw (Sequoyah) from the 4th through the morning of the 6th, fell in several locations, they were not sufficient to bring to an end the drought that had caused agricultural losses (fall-harvested crops, forage, and livestock) as great as \$600 million dollars. The change that drove the drought into the history books began on the 15th. Precipitation reports on the 15th and 16th included 3.87 inches at Shawnee (Pottawatomie), 3.80 inches at the Chickasaw National Recreation Area at Sulphur (Murray), 3.39 inches at Norman (Cleveland), and 3.13 inches at the Lahoma Mesonet site (Garfield).

Abundant, and sometimes torrential, rain began falling, especially in parched southwest and south central Oklahoma, on the 20th. Successive rain-producing systems rolled through the state on what seemed like a daily basis from then through the 29th. Anadarko, Apache (both Caddo), and Chickasha (Grady) reported 9.15, 7.42, and 6.62 inches of rain, respectively on the 23rd, leading to serious flooding in those cities and lesser flooding downstream from them along East Cache Creek and the Washita River. Local flooding was reported in other locations and subsequent rains, particularly in northwestern Oklahoma led to local flooding in locations such as Woodward (Woodward, 5.92 inches on the 25th) and Arnett (Ellis, 5.55 inches, also on the 25th). By month's end, wheat producers who had been eagerly awaiting rain so they could begin fall planting were faced with the prospect of waiting for fields to dry before they could get into their fields.

Severe weather even returned to the state with the new dominant weather regime. Small tornadoes were reported on the 21st (Cotton County near Walters) and 22nd (near Stonewall in Pontotoc County, southeastern Oklahoma City - one just southeast of downtown and one in Valley Brook, where F1 damage was reported -, and in Canadian County near Calumet). The Mesonet site at Boise City recorded a peak wind of 68 miles per hour on the 28th and the site at Woodward recorded a 66 mile-per-hour wind on the 24th.

OKLAHOMA

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 2000 HDD would be calculated as:

$$29 \sum_{i=1} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$30 \sum_{i=1} ((TMAX_i + TMIN_i) / 2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as a mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from the monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24 hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

OKLAHOMA CITY CLIMATE CALENDAR
 DATA COURTESY OF NATIONAL WEATHER SERVICE NORMAN

MONTH December

The data on this calendar is for Oklahoma City.
 Normal values are calculated for the period 1961-1990.
 Temperature extremes are for the period 1891-1999.
 Precipitation extremes are for the period 1891-1999.
